Part 1A – Design the EventEase Database

ERD – Entity Relationship Diagram:

Database Scripts

Bookings Table:

```
CREATE TABLE [dbo].[Bookings] (
    [BookingId]     INT          IDENTITY (1, 1) NOT NULL,
    [VenueId]       INT          NOT NULL,
    [EventId]       INT          NOT NULL,
    [BookingDate]   DATETIME2 (7)  NOT NULL,
    [CustomerName]  NVARCHAR (100) NOT NULL,
    [CustomerEmail] NVARCHAR (100) NULL,
    [CustomerPhone] NVARCHAR (20)  NULL,
    [Status]        INT          NOT NULL,
    CONSTRAINT [PK_Bookings] PRIMARY KEY CLUSTERED ([BookingId] ASC),
```

```
    CONSTRAINT [FK_Bookings_Events_EventId] FOREIGN KEY ([EventId]) REFERENCES [dbo].[Events]
([EventId]),
    CONSTRAINT [FK_Bookings_Venues_VenueId] FOREIGN KEY ([VenueId]) REFERENCES
[dbo].[Venues] ([VenueId])
);

GO
CREATE NONCLUSTERED INDEX [IX_Bookings_EventId]
    ON [dbo].[Bookings]([EventId] ASC);

GO
CREATE NONCLUSTERED INDEX [IX_Bookings_VenueId_BookingDate]
    ON [dbo].[Bookings]([VenueId] ASC, [BookingDate] ASC);
```

Events Table:

```
CREATE TABLE [dbo].[Events] (
    [EventId]     INT           IDENTITY (1, 1) NOT NULL,
    [EventName]   NVARCHAR (100) NOT NULL,
    [Description] NVARCHAR (500) NOT NULL,
    [StartDate]   DATETIME2 (7)  NOT NULL,
    [EndDate]     DATETIME2 (7)  NOT NULL,
    [ImageUrl]    NVARCHAR (MAX) NOT NULL,
    CONSTRAINT [PK_Events] PRIMARY KEY CLUSTERED ([EventId] ASC)
);
```

Venues Table:

```
CREATE TABLE [dbo].[Venues] (
    [VenueId]   INT           IDENTITY (1, 1) NOT NULL,
    [VenueName] NVARCHAR (100) NOT NULL,
```

```
    [Location]  NVARCHAR (200) NOT NULL,
    [Capacity]  INT            NOT NULL,
    [ImageUrl]  NVARCHAR (MAX) NOT NULL,
    CONSTRAINT [PK_Venues] PRIMARY KEY CLUSTERED ([VenueId] ASC)
);
```

Part 1D – Cloud Computing Basics

1. Differences Between Cloud and On-Premises Deployment

Deploying an application in the cloud differs significantly from on-premises deployment in several aspects, notably security, deployment speed, and resource management. In terms of security, cloud providers such as Amazon Web Services (AWS) or Microsoft Azure offer built-in security features including encryption at rest and in transit, automated security updates, and robust identity management (Rountree & Castrillo, 2019). In contrast, on-premises systems require organizations to implement and maintain security measures themselves, which can be costly and prone to human error. Regarding deployment speed, cloud environments enable rapid provisioning of servers and resources, allowing developers to deploy applications in minutes rather than days or weeks, as is often the case with on-premises setups where hardware procurement and configuration delays are common (Armbrust et al., 2010). For resource management, cloud computing provides elasticity, automatically scaling resources up or down according to demand, which is particularly useful for applications with fluctuating workloads. For example, a ticketing application like EventEase could dynamically scale server capacity during high-demand periods, such as when popular event tickets go on sale, without manual intervention. On-premises environments lack this flexibility, typically requiring over-provisioning to handle peak loads.

2. Differences Between IaaS, PaaS, and SaaS

Cloud services are typically categorized into Infrastructure as a Service (IaaS), Platform as a Service (PaaS), and Software as a Service (SaaS), each offering different levels of abstraction. IaaS provides fundamental computing resources such as virtual machines, storage, and networking, giving organizations control over operating systems and applications while still outsourcing hardware management (Mell & Grance, 2011). PaaS offers a higher-level environment, including operating systems, databases, and development frameworks, allowing developers to build and deploy applications without managing the underlying infrastructure (Buyya et al., 2013). SaaS delivers fully functional software applications over the internet, such as Google Workspace or Salesforce, which users can access directly without handling any backend infrastructure. For EventEase, PaaS would likely be the most beneficial choice when moving to the cloud because it provides a ready-to-use development environment that accelerates application deployment, reduces operational overhead, and simplifies scaling during peak event periods. Unlike IaaS, PaaS abstracts infrastructure management, and unlike SaaS, it allows for custom application development, which is crucial for tailoring EventEase to its unique ticketing and event management requirements.
